64K RAM

64K x 8-Bit Fully Static Memory

- ✓ 64K x 8 Bits
- ✓ Fully Static
- ✓ Fully Buffered
- ✓ IEEE 696/S-100
- ✓ Extended Addressing

ELECTRONIC CONTROL TECHNOLOGY, Inc.'s 64K RAM is a low power fully static 64K x 8 bit S-100 bus memory board which utilizes a single supply 2K x 8 bit fully static memory IC with the same pinout as the 2716 EPROM, therefore ROM can be intermixed with the RAM. A DIP switch provides 24 bit extended addressing selection of the board on 64K boundaries; or the board can be used on just 16 bit address. For multi-user systems, 16K can remain global while 48K responds to extended addressing. Portions of the board can be disabled (for memory-mapped disk controllers or ROM) in 2K blocks above E000, in 16K blocks, in any 2K block with jumper wires, or in any block or single address by phantom. All signals to MOS devices are buffered by low power TTL to prevent damage by static electricity and to minimize capacitive loading on the bus. 8080, Z-80 or other CPU's can operate at 2 MHz or 4 MHz (DC to 10 MHz under certain conditions). Low profile IC sockets are provided for all IC's.

SPECIFICATIONS:

BUS: IEEE 696/S-100

MEMORY SIZE: 65,536 x 8 bits

MEMORY TYPE: 2,048 x 8 bit static RAM
6116, 2016, 8725 or equal (2716 EPROM's may be intermixed)

IC ACCESS TIME: 200 nS standard (other speeds optional — 150 nS)

ADDRESS BITS: 24 bits — switch selectable extended addressing

MULTI-USER: 16K can remain global

DISABLE: 16K blocks, 2K blocks above E000, or PHANTOM

BUS LOADING: 1 low power TTL load per line used

POWER (TYPICAL): 300 mA at +8V

SIZE: 5.3" x 10" x 1/16"

PC MATERIAL: FR4 double sided 2 oz. copper with plated through holes

EDGE CONTACTS: 50 per side on 0.125" spacing, gold over nickel plated

FINISH: Solder mask both sides with silk screened legend

SOCKETS: Low profile sockets for all IC's

64K STATIC RAM

Copyright 1982 ECT, Inc.

ELECTRONIC CONTROL TECHNOLOGY, Inc.'s 64K RAM is a low power fully static 64K x 8 bit S-100 bus memory board which utilizes a single supply 2K x 8 bit fully static memory IC with the same pinout as the 2716 EPROM, therefore ROM can be intermixed with the RAM. A DIP switch provides 24 bit extended addressing selection of the board on 64K boundaries; or the board can be used on just 16 bit address. For multi-user systems 16K can remain global while 48K responds to extended addressing. Portions of the board can be disabled (for memory-mapped disk controllers or ROM) in 2K blocks above E000, in 16K blocks, in any 2K block with jumper wires, or in any block or single address by phantom. All signals to MOS devices are buffered by low power TTL to prevent damage by static electricity and to minimize capacitive loading on the bus. 8080, Z80 or other CPU's can operate at 2 MHz or 4 MHz (DC to 10 MHz under certain conditions). Low profile IC sockets are provided for all IC's.

ADDRESSING

The 64K STATIC RAM is configured as one 64K block of memory. Portions of memory may be disabled in a variety of methods - see the section on disable. Address lines A0 - A15 are fixed and define which memory IC on the board is being addressed. The board cannot be addressed to extend across 64K boundaries.

EXTENDED ADDRESSING

Address lines A16 - A23 are decoded to allow the user to configure a system with more memory than 64K. Switch 1 sets up the extended addresses. A16 is the switch closest to the heat sink while the rest of the addresses follow in sequence to A23 the switch closest to the fingers of the board. The switch being ON sets up a logic zero and OFF sets up a logic one. All switches ON set the board for the first 64K. Extended addresses can originate on the CPU board or be derived with a memory manager board. If your system does not have extended addresses read the section on 64K global.

64K GLOBAL

To use the 64K STATIC RAM in a system without extended addresses remove the extended address decoder IC's - IC39 & IC40 the 74LS85's. This will reduce power and eliminate problems caused by floating extended address lines.

16K GLOBAL

In multi-user systems the operating system occupies the upper most 16K of every 64K block. Each user has a dedicated block of 48K as defined by the extended addresses. (Note: to conform to the IEEE 696 "bank select" is done on the CPU board or memory manager board to produce the extended addresses.) Rather than having a separate 16K board for this purpose, one of the 64K STATIC RAM boards can be set up with the upper most 16K responding to all extended addresses (banks) while the first 48K responds only to the one extended address selected. To accomplish this cut the land on the solder side of the board between the two pads in the area labeled 16K global and put in a jumper between the other two pads as indicated on the screen of the 16K global area.

DISABLE

The 64K STATIC RAM is set up to easily disable any one or any combination of the four 16K blocks. Simply jumper the 2 pads associated with each of the appropriate 16K start addresses desired to disable. Note: the upper most 16K start address is C000. The upper most 8K can easily be disabled in 2K blocks for ROM Monitors or disk controllers. Simply jumper the 2 pads associated with the appropriate start addresses (E000, E800, F000 & F800). A few examples of standard start addresses are: ECT's monitor on the R²I/O board - F000 & F800 ; North Star's disk controller - E800 ; Thinker Toy's (Morrow's) disk controller - E000. Any 2K block can be disabled with jumper wires. One of each of the disable pair of pads is an input to the 74LS133. Any unused input to the 74LS133 may be jumpered to any one of the outputs of the 74LS138 chip select decoders to open a 2K window. Any buffered address line or inverted address line or gated combination of buffered address lines and/or inverted address lines can be used with an input of the 74LS133 to open a larger block or a multitude of windows. NOTE: memory IC's from disabled blocks should be removed from the board to conserve power - even though the board is disabled the memory IC's are still enabled.

PHANTOM

The 64K STATIC RAM can be disabled for any byte or block by the Phantom line being controlled by other boards. A three pad jumper area is provided for Phantom. The center pad is one of the 74LS133 input disable leads. It is tied to a pad with a pull up resistor. To use the Phantom jumper the center pad to the other pad as marked on the board. The Phantom line needs only one pull-up resistor in the system. If there is no pull-up elsewhere in the system then leave the on board pull-up in; if there is, then cut the land between the two Phantom pads. NOTE: the input to the 74LS133 must have a pull-up to operate properly.

MEMORY WRITE (MWRT)

MWRT is a signal which is sometimes generated on a system front panel or on the CPU board. If your system is missing this signal just cut the land between the two pads marked MWRT and connect the center pad to the opposite pad and the board will use an internally generated MWRT signal. NOTE: if this jumper is in, the deposit switch on some front panels will not deposit into this board.

INDICATOR LIGHT

The LED is activated whenever the data output drivers of the board are activated - that is, the light goes ON whenever the the extended addresses coincide and the board is being read.

IC LOCATIONS

The memory IC's are numbered 1 - 32 in sequence of addressing. The first 32K is located on the left hand side of the board and the highest 32K is on the right hand side. Location 0000 is IC 1 which is in the upper left hand corner by the heat sink.

2716 EPROMS

2716 EPROM's may be used in the 64K STATIC RAM board. The programming Voltage pin #21 Vpp can interfere with the proper operation of the RAM's. 2716'S can be used on the board by bending pin 21 (Vpp) of each 2716 underneath the IC and soldering a wire directly on the 2716 from pin 21 to pin 24 (Vcc +5V). Use caution when soldering directly to the IC. Do not plug pin 21 into the socket with this jumper wire on it - IC 41 the 74LS00 will be destroyed. On Rev 2 boards there is a land on the solder side of the board by IC 5 that can be cut which will disconnect pin 21 of IC's 1 to 4 from the rest of the memory IC's. If these are cut free, a jumper wire can be soldered on the solder side of the board from pin 24 of IC 5 to the pad next to it. This will eliminate the need for jumper wires on IC's 1 to 4 - the first 8K of memory (ROM 2716's). Note: one or two 2716's may operate in the board without modification.

WARRANTY

ELECTRONIC CONTROL TECHNOLOGY, hereinafter referred to as ECT, in an effort to assure its customers that it is providing them with quality products, components and workmanship, hereby warrants its products as follows:

All products both in kit form and assembled units sold by ECT are manufactured from components purchased through factory distribution and any part which fails because of defects in workmanship or material will be replaced at no charge for a period of three (3) months following the date of purchase. The defective part must be returned postpaid to ECT within the warranty period.

Any fully assembled kit, which fails to perform satisfactorily, may be returned to ECT within the warranty period, and if in the judgement of ECT it has been assembled with care and has not been subjected to electrical or mechanical abuse, it will be restored to proper operating condition and returned, regardless of the cause of malfunction, with a minimal charge to cover shipping and handling.

Any unit purchased as a kit and returned to ECT and which in the judgement of ECT is not covered by this warranty will be repaired and returned at a cost commensurate with the work required. In no case will this charge exceed twenty dollars (\$20.00) without prior notification to and approval by the owner.

Any product purchased as an assembled unit is guaranteed against defects in materials and workmanship and is further guaranteed for a period of three (3) months to meet the specifications in effect at the time of manufacture. All warranted factory assembled units returned to ECT postpaid will be repaired and returned without charge.

This warranty is made in lieu of all other warranties expressed or implied and is limited in any case to repair or replacement of the ECT product involved.
